

THE ULTIMATE CIRCULAR ECONOMY

PLARICK

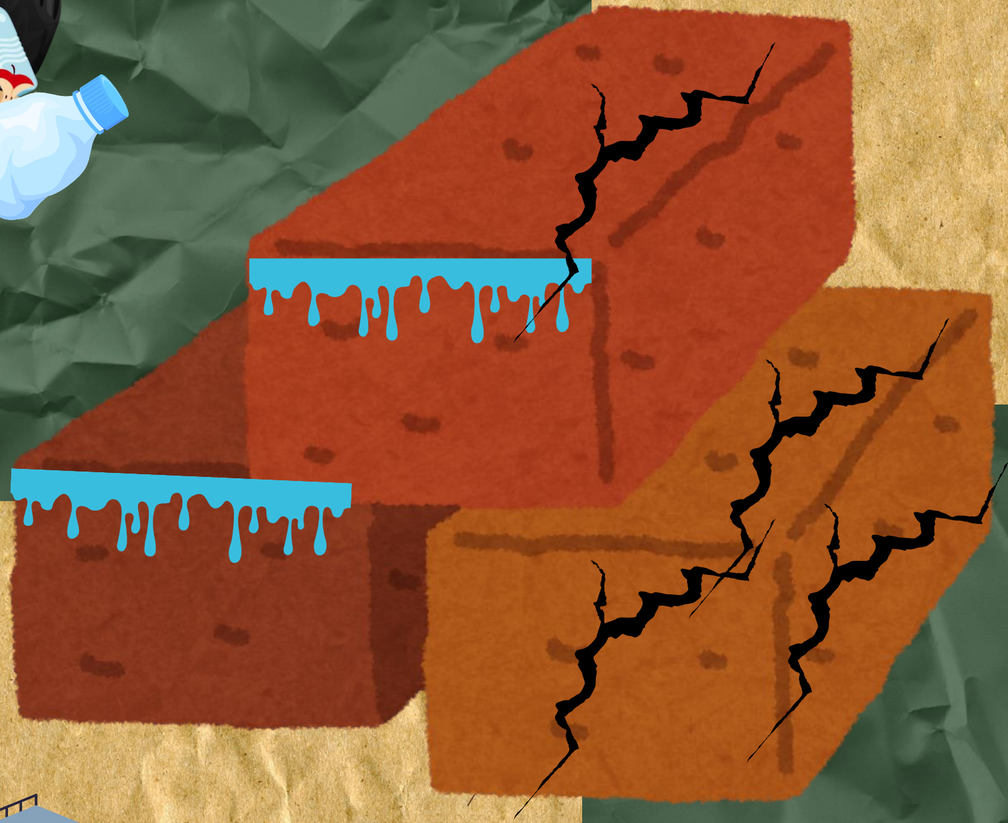

Aarav Jain , Aarav Jain, Shreshtha

WHAT IS
THE PROBLEM?
PLASTIC WASTE

THE PROBLEM

11
SUSTAINABLE CITIES
AND COMMUNITIES

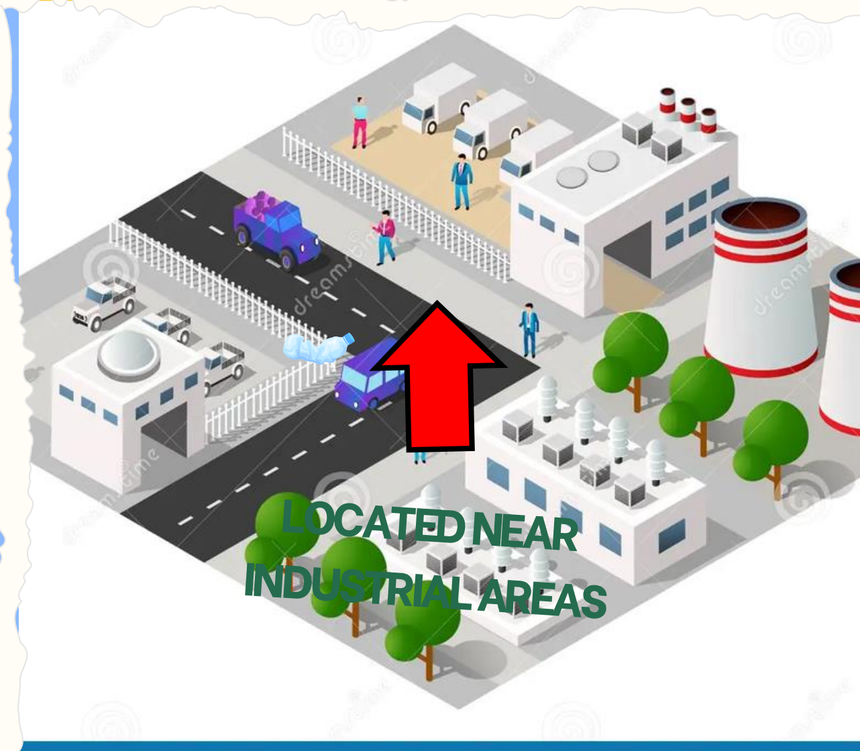

COLLECTION OF PLASTIC

PRIMARY COLLECTION: Industrial Sites

SECONDARY COLLECTION: Companies segregating plastic wastage from landfills

SHREDDED PLASTIC → BRICK

Obtain Plastic Wastage

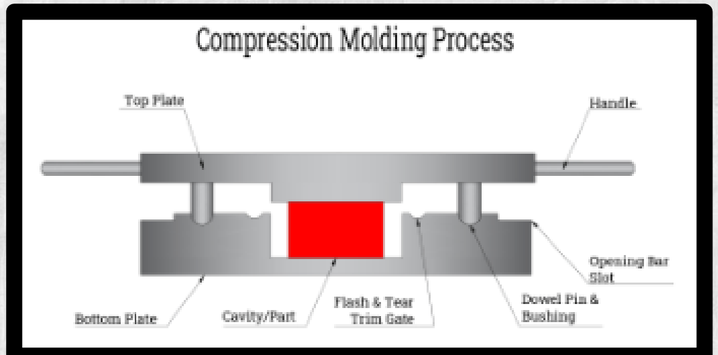

Mix With Other RM

HDPE
PET
PP
CALCIUM
SAND
LIMESTONE
PHOSPOROUS

250 Celcius

Compression Moulding

Transportation

CIRCULAR

ECONOMY

REDUCED PLASTIC WASTAGE

We will be able to process plastic waste generated by 50,000 people every year

SUSTIANABLE PRODUCTION

Comparatively sustainable production method than conventional clay bricks.

REUSE, REDUCE & RECYCLE

ENVIRONMENTAL

SUSTAINABILITY

We aim to solve the challenge of UV degradation, microplastics and flammability through a TEFLON or Phosphorous coating

SUSTAINABILITY

IMPROVED SEEPAGE PROTECTION

ALMOST 0 SEEPAGE

LOW MAINTAINANCE COST

INCREASED DURABILITY

Plastic: 131.8 N/mm2

Concrete: 17.1N/mm2

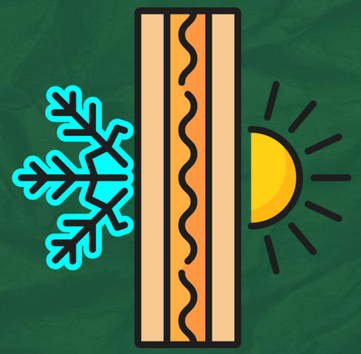

SOCIAL

THERMAL INSULATION

Primarily in regions of extreme temperatures

Reduces Energy needed for temperature regulation

IMPROVED HEALTH

Reduced effects of plastic wastage, toxins and fumes

EMPLOYMENT

Segregation, Operations and Transportation

IMPROVED WORKING CONDITIONS

Manafacturing Process: Closed System

hollow bricks reduce transport costs and labour

ECONOMIC

SUSTAINABILITY

COST EFFICIENCY

CEMENT BRICKS: $0.7

PLARICK: $0.5

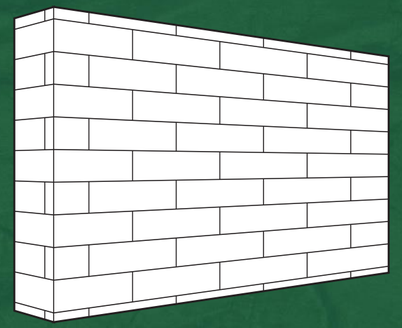

TARGET MARKET

No cement requirement

Interlocking design

TEMPORARY HOUSING

GLOBAL ANNUAL MARKET: $47 Billion

EXPECTED: $65 Billion by 2030

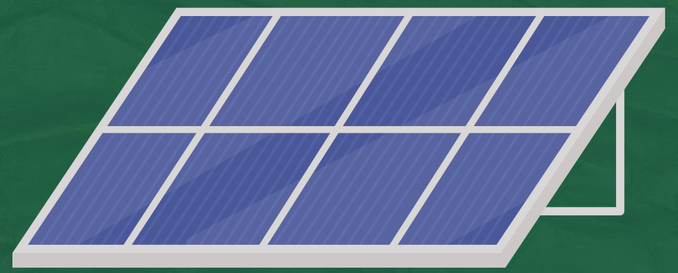

Energy-efficient systems.

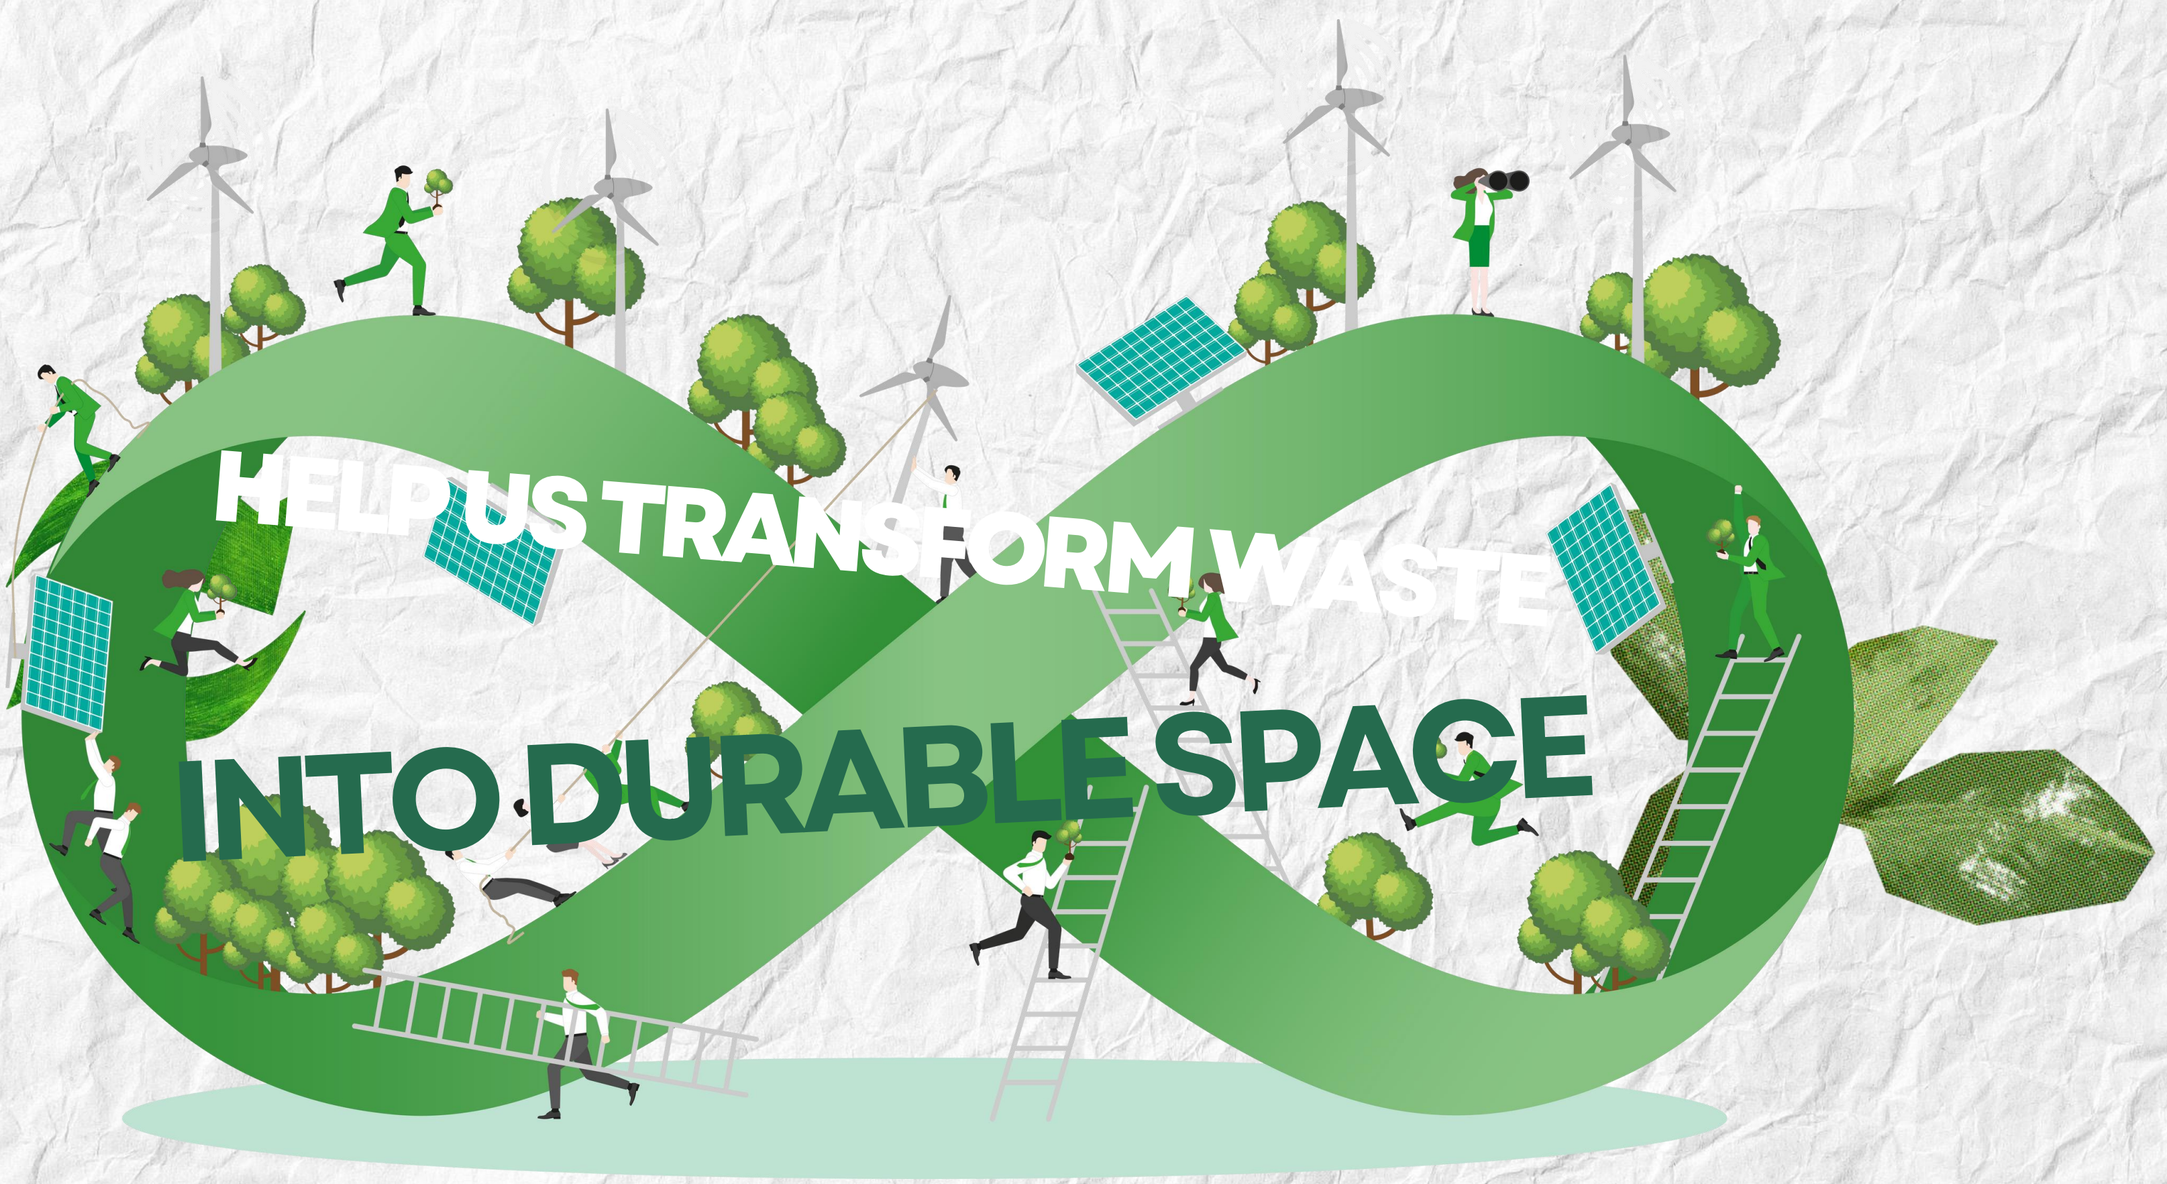

Coal used to manafacture Traditional Clay and Cement Bricks

Solar energy is the primary source of power.
SOLAR PANELS

HELP US TRANSFORM WASTE
INTO DURABLE SPACE
